Launch Vehicle Leading Design

Material Selection

Airframe Sections

Fin Configuration

Launch Vehicle Dimensions

- Length: 104.5 in.
- Launch Weight: 43.22 lb.
- Diameter: 6.17 in.
- Comprised of 6 sections

Launch Vehicle Stability

- Center of Gravity: 61.2 in. from tip of nose cone
- Center of Pressure: 74.9 in. from tip of nose cone
- Static Stability: 2.15 cal.

Chosen Material: G12 Fiberglass

- Blue Tube 2.0
 - Vulcanized fiber-based
 - Abrasion resistant and durable material properties
 - Inexpensive
 - Lightweight
 - Prone to water damage without additional treatment
- G12 Fiberglass
 - Filament wound fiberglass
 - Highly durable and damage resistant
 - More expensive than blue tube
 - Heavier than other options
 - Water resistant

Note: Both materials provide adequate strength to withstand the forces of flight

Chosen Nose Cone: 5:1 Ogive

- Conical
 - Simple design
 - Not optimal for subsonic speeds
- Elliptical Design
 - Optimal for subsonic speeds
 - Minimizes skin friction drag
 - Not commercially available
- Ogive
 - Many geometries available and sold by large retailers
 - 5:1 Ogive gives a desirable stability margin in RockSim simulations
 - Added length/weight improves stability

Chosen Nose Cone Bulkhead: Removable

- Removable Bulkhead
 - Permanent centering ring that bulkhead is bolted to
 - Allows for accessibility to adjust ballast on the forward side
 - More parts to manufacture, more failure points
 - 1 lb. of permanent ballast and 1 lb. of removable ballast

Main Parachute Bay

- Located between the nose cone and avionics bay
 - Shear pin connection to nose cone
 - Bolted connection to avionics bay
- 20 in. length

Avionics Bay

- Between the main parachute bay and drogue parachute bay
- Modular, 2 bulkhead design allows for accessibility to the avionics sled
- Easily accessible blast caps and U-bolts

Drogue Parachute Bay

- Located between the nose cone and avionics bay
 - Shear pin connection to avionics bay
 - Bolted connection to payload bay
- 1 in. length

Payload Bay

- Between the avionics bay and the fin can
 - Shear pin connection to avionics bay
 - Bolted connection to the fin can
- Modular 2-bulkhead design functions similar to AV Bay.
 - Allows for payload electronics to be attached to a sled.
- 1 in. long, 4 in. airframe band

Fin Can

- Removable Fin System
 - Allows for easy repairs
- Overall length 31 in. including tailcone
- 6 in. Ogive tail cone used to reduce turbulent airflow

Removable Fin System

- Fins are bolted to runners that span the centering rings
- Threaded rods support assembly and attach the thrust plate
- Thrust plate ensures motor force is directly transferred to the airframe

Recovery Subsystem Leading Design

Recovery Locations

- Drogue Parachute is found in the drogue parachute bay
- Main Parachute is found in the Main parachute bay
- Avionics bay is where all recovery electronics are

Recovery Overview

- Drogue deploys at Apogee
 - Secondary is approximately 1 sec after apogee
- Main deploys at 550 ft.
 - Secondary charge at 500 ft.
- Objective is the safe recovery of all parts of the launch vehicle and payload

Altimeter Comparison

| Altimeter | Deployment Variability | Altitude Recording Resolution | Dimensions | Data Recorded | Price | Owned by Club |
|-----------------|---|-------------------------------|---------------|--|----------|---------------|
| RRC3 | 300 to 3000 ft 100 ft Increments | 1 ft | 3.92" x .925" | Altitude, Velocity, Temperature | \$96.50 | Yes |
| Entacore AIM | 100 to 100,000 ft 1 ft increments | 1 ft | 2.75" x .984" | Altitude, Velocity, Temperature | \$121.15 | Yes |
| Stratologger CF | 100 to 9999 ft 1 ft Increments | 1 ft | 2" x .84" | Altitude, Voltage, Temperature | \$69.95 | Yes |
| EasyMini | 100 to 100,000 ft 100 ft increment on ascent 10 ft increment on descent | 1 ft | 1.5" x .8" | Altitude, Velocity, Acceleration, Temperature, Voltage | \$96.93 | No |

Tracker Alternatives

**BigRedBee
900**

BigRedBee Beeline

LightAPRS+W

Eggfinder GPS

Altimeter Arming Switches

Pull-Pin Switches

Mechanical arming switches that can be locked in the “ON” position

Drogue Parachute Alternatives

| Parachute | Drag Coefficient | Descent Velocity | Descent time from Apogee to Main Deployment | Wind Drift (20 mph) From Apogee To Main Deployment | Does the Club Own It? |
|--|------------------|------------------|---|--|-----------------------|
| Fruity Chutes 12" Classic Elliptical | 1.34 | 172.91 ft/s | 22.84 | 670 ft | No |
| Fruity Chutes 15" Classic Elliptical | 1.37 | 136.69 ft/s | 28.89 seconds | 847 ft | No |
| Fruity Chutes 18" Classic Elliptical | 1.43 | 111.6 ft/s | 35.39 seconds | 1038 ft | Yes |
| Fruity Chutes 24" Classic Elliptical | 1.47 | 82.43 ft/s | 47.92 seconds | 1406 ft | Yes |
| Fruity Chutes 24" Compact Elliptical | 1.41 | 84.37 ft/s | 46.81 seconds | 1373 ft | Yes |

Main Parachute Alternatives

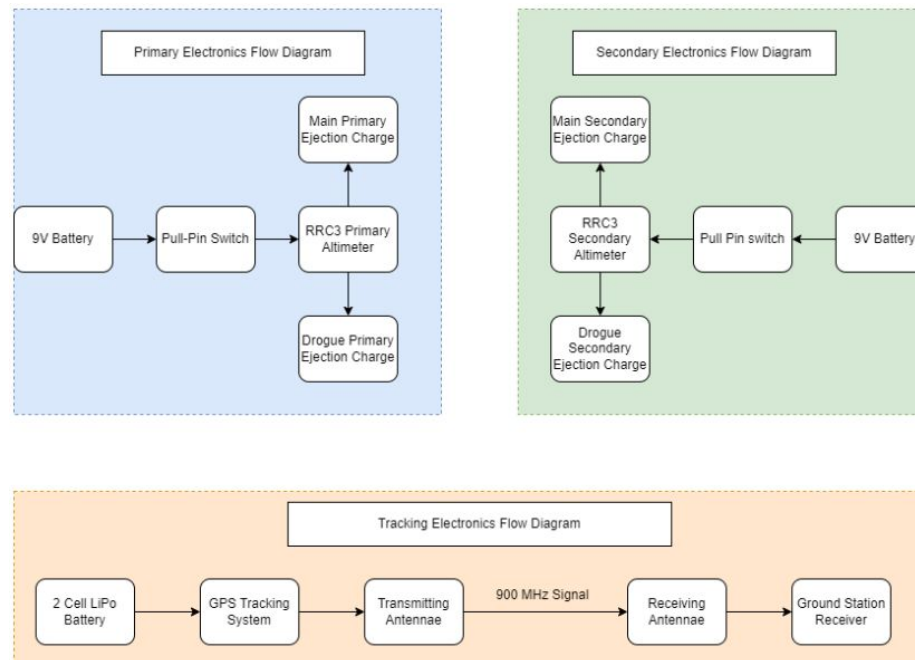

| Parachute | Drag Coefficient | Landing Velocity | Impact Kinetic Energy | Descent time from Main Deployment | Wind Drift (20 mph) From Main Deployment | Does the Club Own It? |
|---|------------------|------------------|-----------------------|-----------------------------------|--|-----------------------|
| Fruity Chutes 72" Iris UltraCompact | 2.033 | 23.38 ft/s | 173.04 ft-lbf | 23.51 seconds | 690 ft | No |
| Fruity Chutes 84" Iris UltraCompact | 2.134 | 19.56 ft/s | 121.1 ft-lbf | 28.11 seconds | 825 ft | No |
| Fruity Chutes 84" Iris Ultra Standard | 2.131 | 19.58 ft/s | 121.27 ft-lbf | 28.09 seconds | 824 ft | Yes |
| Fruity Chutes 96" Iris UltraCompact | 2.087 | 17.31 ft/s | 94.8 ft-lbf | 31.77 seconds | 932 ft | No |
| Fruity Chutes 120" Iris UltraCompact | 2.105 | 13.79 ft/s | 60.16 ft-lbf | 39.88 seconds | 1170 ft | Yes |
| Fruity Chutes 144" Iris UltraCompact | 2.118 | 11.46 ft/s | 41.52 ft-lbf | 48.01 seconds | 1408 ft | No |
| Rocketman 120" Pro-X | .855 | 21.64 ft/s | 148.19 ft-lbf | 25.41 seconds | 745 ft | Yes |

"Sport" Altimeter

Leading Parachute Configuration

- Drogue
 - Fruity Chutes 18 in. Compact Elliptical
 - Nomex Sheet Protected
- Main
 - Fruity Chutes 120 in. Iris UltraCompact
 - Nomex Sheet Protected
 - Allows landing kinetic energy to be below 65 ft-lbf

**Fruity Chute Iris
UltraCompact**

Wind Drift and Descent Time

Calculated based on constant wind down range.

Maximum Wind Drift

- 2208 ft

Descent Time

- 75.7

$$t = \frac{h_a - h_m}{v_d} + \frac{h_m}{v_m}$$

| Wind Velocity | Drift Distance |
|---------------|----------------|
| 0 mph | 0 |
| 5 mph | 552 |
| 10 mph | 1104 |
| 15 mph | 1656 |
| 20 mph | 2208 |

Kinetic Energy

| Section | Mass of Section | Descent Velocity Necessary to be Awarded Points | Descent Velocity Necessary to be Awarded Bonus Points |
|--|-----------------|---|---|
| Nose Cone | .207 slugs | 26.92 ft/s | 25.06 ft/s |
| Main Parachute Bay and Avionics Bay | .220 slugs | 26.11 ft/s | 24.31 ft/s |
| Drogue Parachute Bay, Payload Bay, and Fin Can | .632 slugs | 15.4 ft/s | 14.34 ft/s |

| Section | Mass of Section | Velocity Under Main Parachute | Impact Energy |
|--|-----------------|-------------------------------|---------------|
| Nose Cone | .207 slugs | 6.11 ft/s | 4.247 ft-lbf |
| Main Parachute Bay And Avionics Bay | .220 slugs | 9.16 ft/s | 9.230 ft-lbf |
| Drogue Parachute Bay, Payload Bay, and Fin Can | .6332 slugs | 13.79 ft/s | 60.206 ft-lbf |

Opening Shock

Shock force generated from opening the main parachute: 316.63 ft-lbf

Kevlar Rated at: 6600 ft-lbf

Factor of Safety: 20.8

| Section | Mass of Section | Opening Shock |
|--|-----------------|----------------|
| Nose Cone | .207 slugs | 56.488 ft-lbf |
| Main Parachute Bay And Avionics Bay | .220 slugs | 60.036 ft-lbf |
| Drogue Parachute Bay, Payload Bay, and Fin Can | .6332 slugs | 172.741 ft-lbf |
| Total | 1.161 slugs | 316.633 ft-lbf |

Main Deployment Opening Shock

Leading Payload Design

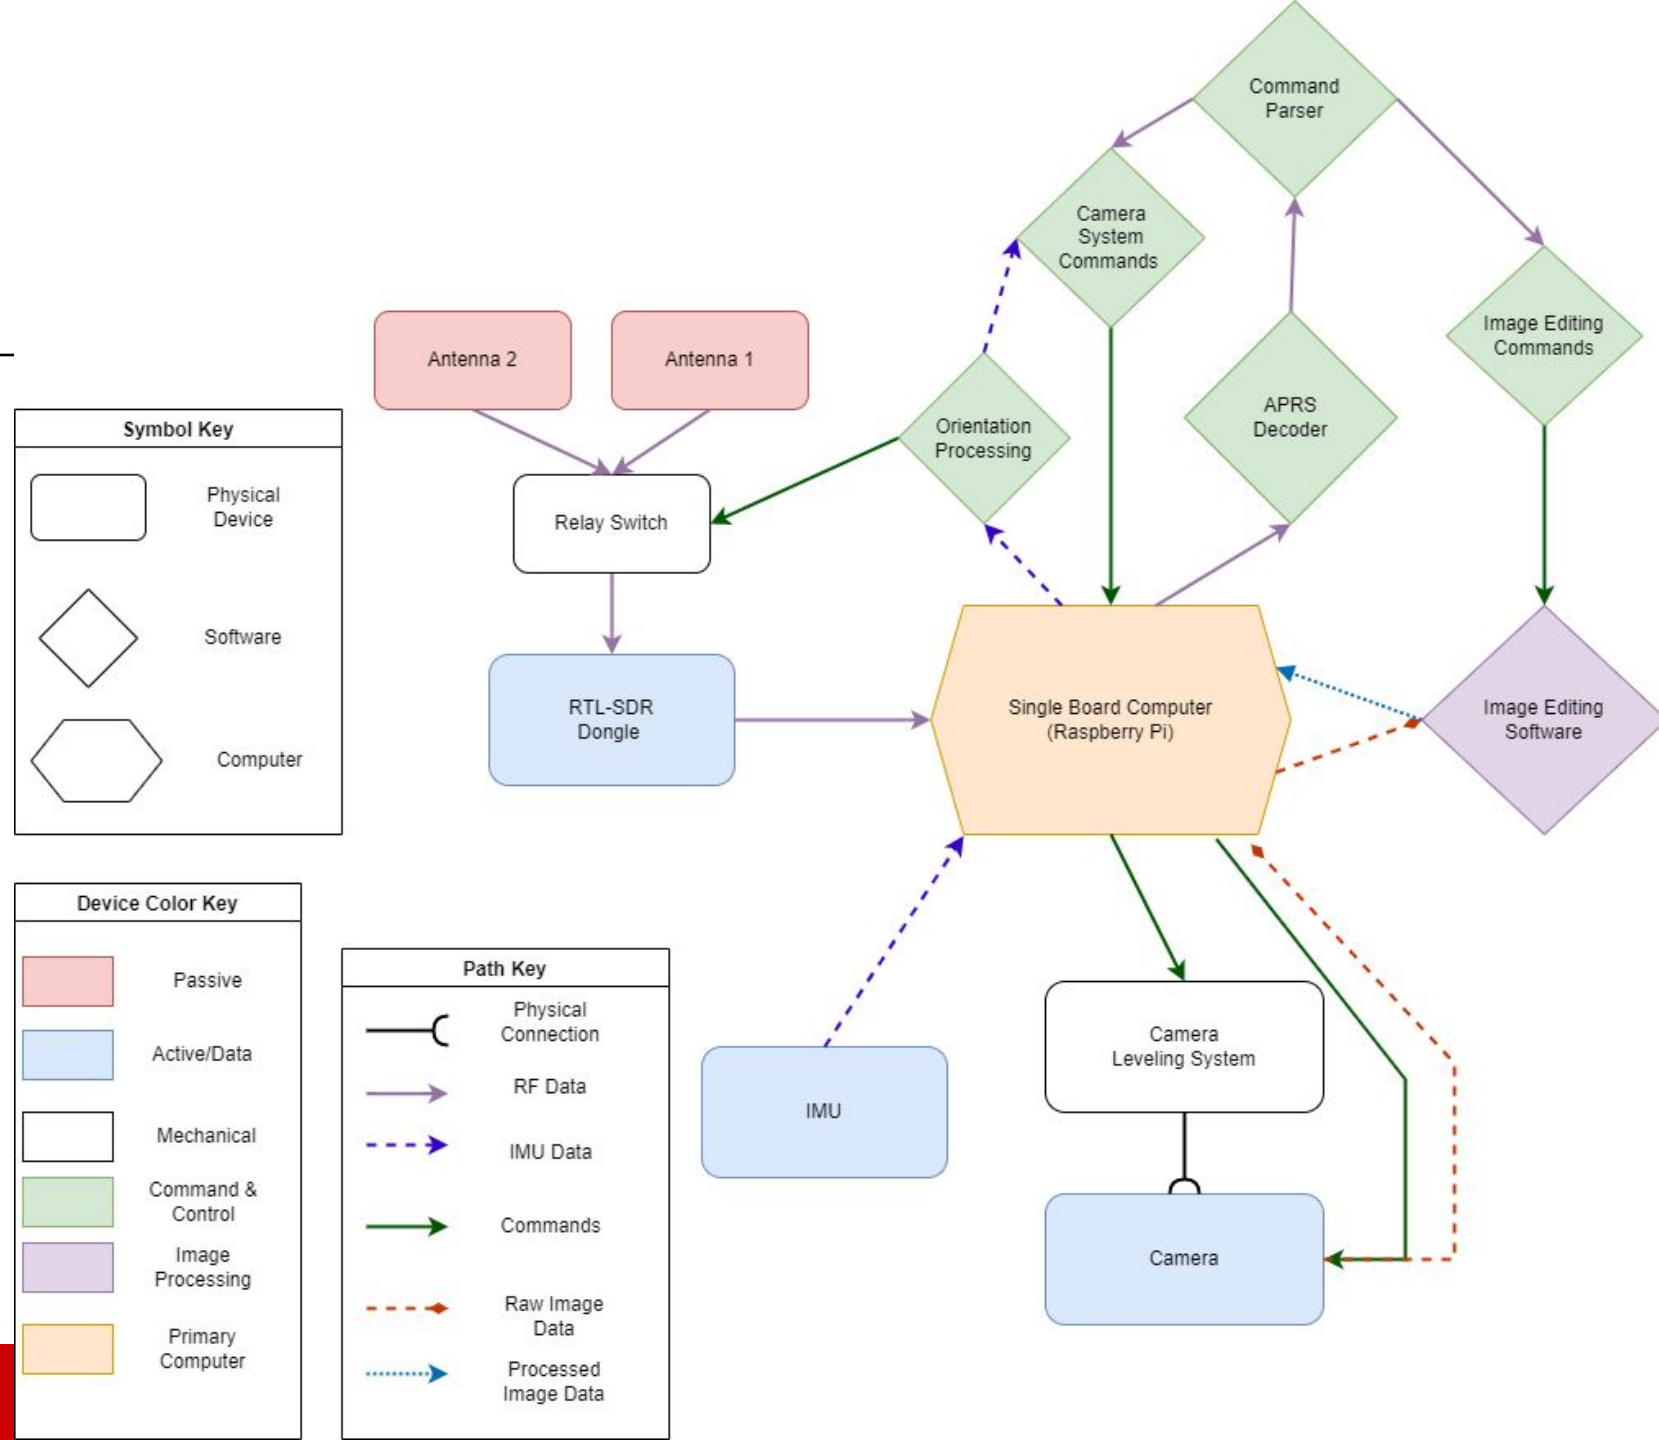

System Overview
RAFCO subsystem
Camera subsystem

Payload Objective and Requirements

- Camera capable of rotating 360° around axis normal to the ground, with a clear view of the launch field
- On-board image editing including timestamping, filters, and color removal
- Receive RF commands transmitted over APRS (Automatic Packet Reporting System) on the 2-meter radio band, between 144.90 MHz and 145.10 MHz
- System performs commands within 30 sec

Payload System Overview

Payload System Components

- Two major subsystems:
 - RAFCO (radio frequency commands) system
 - Camera system
- Each of these subsystems consists of electronic hardware and software designed to support their final purpose
- These subsystems both interface with or exist as software on a Raspberry Pi, the main payload computer

Payload System Design Philosophy

- The primary design philosophy behind this payload design is to accomplish the design challenge with the least amount of complications possible
- This emphasizes reliability, ease of construction, and simplicity of operation

Camera Subsystem Overview

The payload bay with camera components.

A close-up of the camera system.

Camera Subsystem Overview

- Each assembly consists of four parts:
 - Pi-compatible camera
 - Protruding camera housing
 - Servo
 - Camera mount
- Multi-camera adapter integrates the four assemblies

Camera Assembly

- Camera = Arducam IMX-219
- Servo = Feetech FS90R
- Mount = PLA plastic, custom
- Housing = Custom
printed/formed

Arducam

- FOV up to 180°
- 36x36mm
- Compatible with multi-camera adapter

Fig. 1: The Arducam IMX-219 camera module.

Multi-Camera Adapter Board

- Pi relay board for up to four cameras
- CSI I/O
- Camera choice made based on IMU data
- Challenges:
 - Pin headers
 - CSI fragility

Fig. 1: The Arducam Multi Cam Adapter Board.

Transparent Camera Housing

- Housings protect from air and debris
- Teardrop vs. Dome
- Vacuum-forming vs. SLA

RAFCO Subsystem Overview

- Consists of four parts:
 - 2-meter band antenna
 - RTL-SDR dongle
 - APRS decoder and command parser software
 - Inertial Measurement Unit (IMU)
 - Used to determine orientation

2-Meter Band Antenna

- Antenna designed to receive frequencies in the 2-meter band (~144 MHz) is needed
- A variety of options are available, only a few types and sizes are viable for the intended use case
- Selection was narrowed down to $\frac{1}{4}$ -wave whip antenna and $\frac{1}{2}$ -wave dipole antenna
- As the names suggest, these antenna types are, respectively, a quarter and half the wavelength of the selected band

Antenna Comparison

$\frac{1}{4}$ -Wave Whip

- ~20 in.
- Off the shelf
- Requires a large external ground plane
- Omnidirectional (except along axis)
- Must be mounted vertically (normal to ground plane)
- May bend slightly depending on formfactor

$\frac{1}{2}$ -Wave Dipole

- ~40 in.
- Easily constructible
- Requires no external grounding
- Omnidirectional (except along axis)
- Can be mounted horizontally
- Can be slightly curved

Antenna Mounting

- Internal
 - Mount the antenna inside the payload bay
 - Only requires a single antenna
 - Antennas are too long for this to be feasible
 - Material attenuation and interference from other payload electronics
- Along Launch Vehicle
 - Mount the antenna along the outside of the launch vehicle
 - Requires at least two antennas so one is always clear of the ground
 - Results in some additional aerodynamic drag
 - Potential damage to antennas during landing
- Inside Fins
 - Mount antenna inside fins
 - Requires at least two antennas
 - Fins would have to be very long to fit the majority of the antenna
 - Material attenuation

Antenna Selection

- Two $\frac{1}{2}$ -wave dipoles 180° apart
- Located on the outside of the fin can + payload bay
- lack of a need for vertical mounting and large ground plane

Dipole Antenna Operational Diagram

Antenna Selection (Cont.)

- Antennas cannot be connected in parallel
- Two-channel relay is used to switch which antenna is in use
- Decision is made based on IMU data

Two-Channel Relay

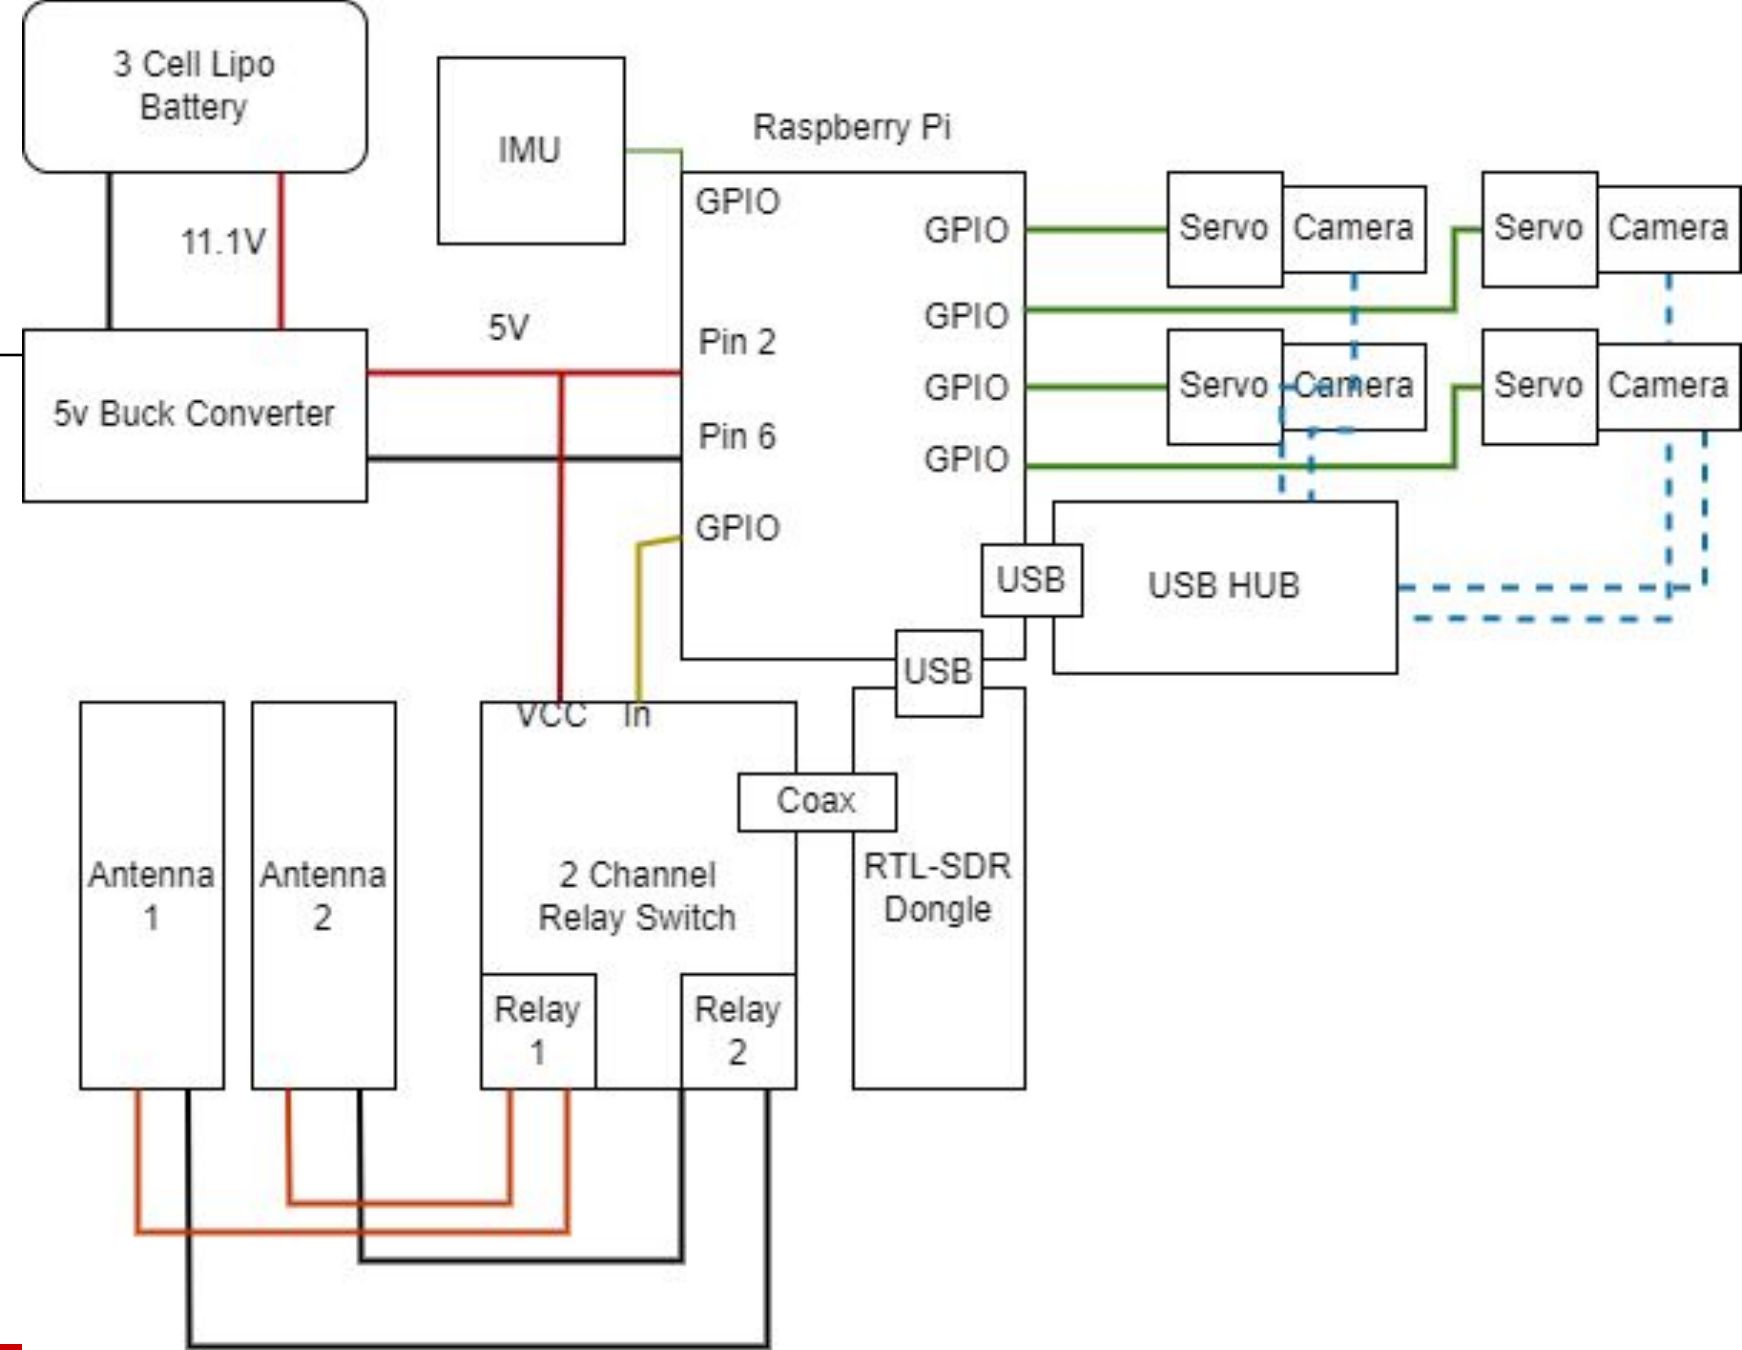

RTL-SDR Dongle

- This design will utilize a Nooelec NESDR SMARt v4 SDR
- The RTL-SDR dongle serves as the interface between the antenna(s) and the Raspberry Pi
- Converts analog signals to digital using a Realtek RTL2832U & R820T2

Payload System Block Diagram

Electronics Integration

- Rectangular Sled will be held in place by 2 threaded rods.
- Sled will be angled so that it doesn't interfere with the camera housings
- Activated using Pull-Pin Switch
- Antenna attaches to RTL-SDR Dongle
- Pi decodes and parses commands

Mission Performance Predictions

Motor Alternatives

| Motor | Total Impulse (N-s) | Initial Thrust (N) | Maximum Thrust (N) | Average Thrust (N) | Burn Time (s) | Length (mm) |
|--------|------------------------|-----------------------|-----------------------|-----------------------|------------------|----------------|
| L1390G | 3949.0 | 1416.5 | 1675.0 | 1390 | 2.6 | 530 |
| L1420R | 4603.0 | 1458.3 | 1814.0 | 1490 | 3.2 | 665 |
| L1520T | 3715.9 | 1545.4 | 1765.3 | 1520 | 2.4 | 518 |

- Motors fit RMS-75/3840 motor casing

Motor Selection

- Aerotech L1520T
- RMS 75/3840 Casing

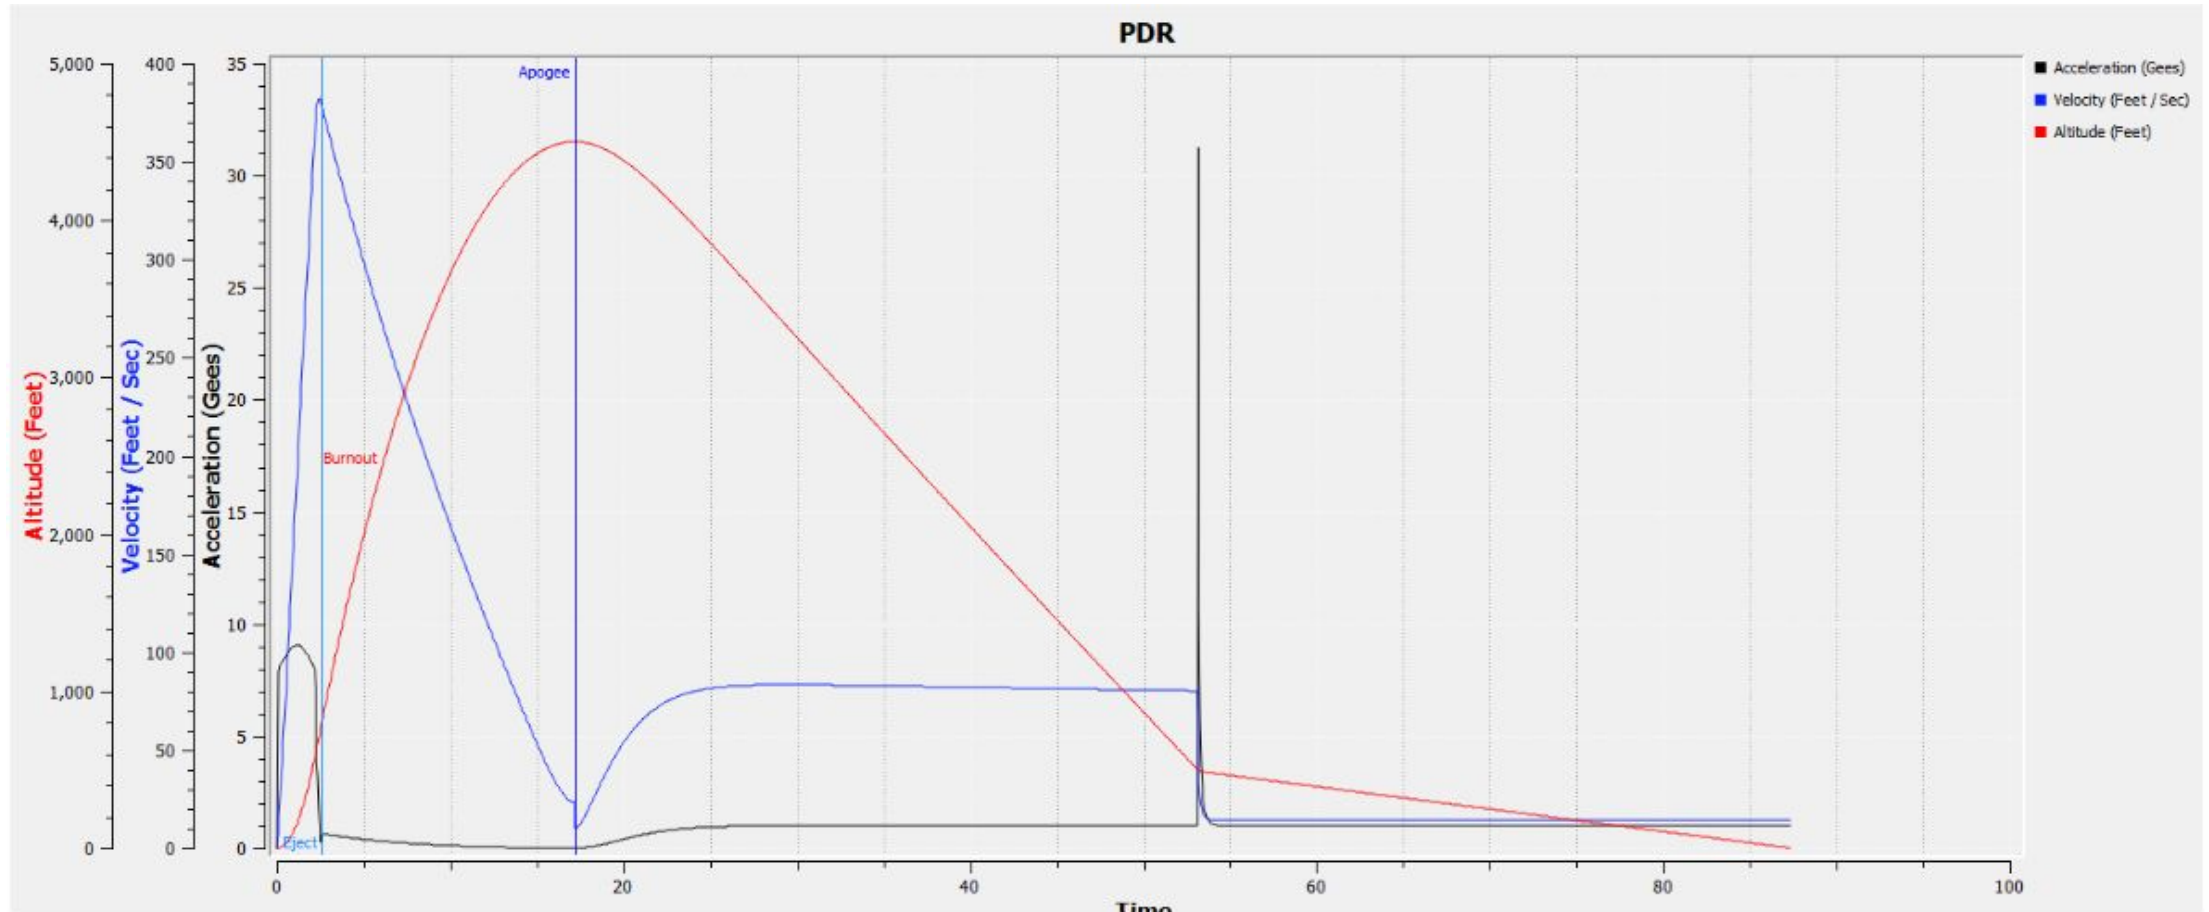

Performance

- Target Apogee: 4,500 ft.
- Based on
 - Rocksim model with
 - 5-15 mph winds
 - 5° cant
 - 144 in. launch rail
 - Hand Calculations (4,455 ft)
- Thrust to Weight Ratio: 8.03
- Rail Exit Velocity: 74.6 ft/s

Predicted Altitude, Velocity, and Acceleration

Payload Weight Apogee Study

- Payload weight will affect apogee
- Weights between 5 lb. and 7 lb. acceptable
 - Ideal payload weight is 6 lb.
- Frames payload weight changes as it relates to apogee

Payload Stability Margin Study

- Aft located payload greatly affects stability
- Changes in both overall payload weight and the location of weight within the payload affect stability.

Fin Stability Study

- Stability margin was calculated via RockSim and by hand calculations.
- Hand calculations assumed trapezoidal fin area.

| Method | Result | Comparison |
|--------------------|---------------|--------------------|
| RockSim | 2.15 calibers | $\%diff = 21.58\%$ |
| Barrowman's Method | 2.67 calibers | |

Requirements Compliance

Requirements Compliance Plan

- Each requirement has its own needs
- Requirements verified by analysis done by CDR
- Test plans supplied with CDR, verified by FRR
- Inspection/Demonstration requirements verified by FRR
- Most require full scale to be built and/or launched

Team Derived Requirements

- Developed for Vehicle, Payload, Recovery and Safety
- Designed to increase chance for success of the launch vehicle and payload and the increased safety of the project
- EX
- PD 3: The antenna SHALL face upwards upon landing regardless of landing orientation.
- LVE 2: The launch vehicle SHALL be water-resistant.

Risk Assessment Matrix

- Supplementary hazard analysis
- Difference in failure modes before/after mitigation
- 65 failure modes pre-mitigation: 50.39%
- 19 failure modes post-mitigation: 14.73%

| Risk Assessment Before Mitigation | | | | | |
|-----------------------------------|--------------------|-------------------|------------------|----------------|------------------|
| | | Level of Severity | | | |
| | | 1 Low Risk | 2 Medium Risk | 3 High Risk | 4 Severe Risk |
| Likelihood of Occurrence | A Very Unlikely | 0.08% | 1.55% | 5.43% | 5.43% |
| | B Unlikely | 3.88% | 6.98% | 7.75% | 3.10% |
| | C Likely | 5.43% | 6.20% | 6.98% | 5.43% |
| | D Very Likely | 6.20% | 17.83% | 15.50% | 1.55% |
| Risk Assessment After Mitigation | | | | | |
| | | Level of Severity | | | |
| | | 1 Low Risk | 2 Medium Risk | 3 High Risk | 4 Severe Risk |
| Likelihood of Occurrence | A Very Unlikely | 8.53% | 14.73% | 7.75% | 6.20% |
| | B Unlikely | 8.53% | 10.08% | 8.53% | 4.65% |
| | C Likely | 7.75% | 10.85% | 6.98% | 1.55% |
| | D Very Likely | 1.55% | 2.33% | 0.00% | 0.00% |
